

Latest buzz on bee decline: Maybe it's pesticides

A common class of pesticide is causing problems for honeybees and bumblebees, important species already in trouble, two studies suggest.

But the findings don't explain all the reasons behind a long-running bee decline, and other experts found one of the studies less than convincing.

"The simple fact is, we know enough to take decisive action on this class of pesticides which covers well over 143 million acres of U.S. countryside," said Heather Pilatic, co-director of the Pesticide Action Network North America.
